1999 National Opinion Poll

EDUCATION

By David A. Bositis

INTRODUCTION

During 1998 and 1999, in most major U.S. public opinion polls, education has been identified as the most important problem facing elected officials and policymakers. The two major elements of education as an issue are the quality of education (challenges of the new global economy, testing, computers, social promotion, school vouchers, and reading and math scores) and, especially after the killings at Columbine High School this spring, school safety. Within this overall focus has been a particular concern about failing inner city schools and the quality of education received by African American and other minority students.

The 1999 Joint Center for Political and Economic Studies National Opinion Poll is a national survey of 1,678 adults, conducted between May 5 and May 29, 1999. The survey's questions cover a broad range of topics including politics, education, crime and criminal justice policy, the 2000 Census, immigration, and race relations.

The survey has two components: a national general population sample of 850 adults and a national sample of 900 adult African Americans. There are 72 African American respondents in the general population sample who are also part of the national sample of African Americans.

Thus, in total, there are 1,678 adults, 18 years of age or older, who are included in this study. This release of findings is on education issues. The first two releases from the survey covered politics and the 2000 Census. In the following months, the Joint Center will release findings on the other areas identified above. The survey methodology is described in an accompanying appendix.

For the past four years, The Joint Center for Political and Economic Studies National Opinion Poll has tracked the attitudes of African Americans and the general public in the area of education¹. This report is the fourth in that series. Like the earlier reports, it looks at issues of school quality, school safety, support for spending on education, and school vouchers.

While both black and white Americans rank education as the most important national problem, their views on education issues may differ considerably. Age, income, and ideology also influence individual views on education. That is, there are differences in views between older and younger adults, between poorer and wealthier persons, and between liberals and conservatives.

In the Joint Center's 1999 National Opinion Poll, while whites' views on education changed little, African Americans' views on education issues were generally less optimistic than those expressed in the 1998 survey. There are several possible explanations for this shift. First, African Americans were unusually optimistic in the 1998 poll, when for the first time, more blacks than whites indicated that they were financially better off than a year earlier. A generalized optimism or pessimism, usually associated with personal financial well-being, can frequently influence a person's opinions on other unrelated issues. Second, the national debate on school vouchers

focuses especially on minority students and emphasizes the poor performance and quality of many of the schools they attend. Further, many states with new statewide testing systems have reported large numbers of failing schools, especially schools with large minority enrollments. Finally, there is considerable volatility in the public's opinions on certain education issues, partially due to the fact that many people do not possess solid first-hand knowledge of what is going on in the schools². Hence, media coverage of certain issues and events can cause significant shifts in public opinion.

On balance, black respondents in 1999 rated their local public schools more negatively than a year earlier, and a larger percentage of them believe their local public schools are getting worse. These views may be a reason that black support for school vouchers increased significantly from last year, with three in five blacks supporting school vouchers. In addition, there is solid black support for statewide standards and tests, although a significant minority of African Americans believe such standards and tests are unfair to minority group members. In the 1999 survey, as in the previous year's survey, there is very strong support among black Americans for increased government spending on education. Finally, and on a positive note, in the 1999 survey, significantly fewer (20 percent) African Americans reported violent incidents at schools near where they live than in the Joint Center's 1996 survey.

In the 1999 survey, whites reported fairly high levels of satisfaction with their local public schools, and they are more likely to think the schools are improving than regressing. Like African Americans, whites also support increased school spending, reported fewer violent incidents at their local schools, and increasingly support school vouchers. Finally, whites overwhelmingly support statewide standards and tests, and proportionally few of them express concern about the possible unfairness associated with those standards and tests.

1996-1999: AREAS OF CONTINUITY

While the Joint Center's 1999 National Opinion Poll shows African Americans having more negative views of their local public schools than in 1998 and reveals increasing support for school vouchers, it also shows several areas where there is significant continuity over the 1996-1998 time period. There continues to be significant public support for increased school funding from both blacks and whites. Support for school vouchers has fluctuated over the past four years, but African Americans have consistently been more supportive than whites. Also, while there has been a certain volatility in African Americans' ratings of the local public schools, over this time period a significantly smaller proportion of blacks than whites rated their local schools as excellent or good; except for 1998, this gap between black and white ratings has been approximately 20 percentage points.

Other previously seen patterns and trends revisited in 1999 were especially related to generational differences; for example, persons under 50 years of age, black and white, were more concerned with education than those older than 50. Also apparent in the 1999 survey is the emergence of the "morals vs. money" divergence in education, with some conservatives showing significantly less support for spending more money on education than either political liberals or moderates.

THE WASHINGTON DEBATE ON EDUCATION

The partisan debate in Washington on education has several facets. Both Republicans and Democrats are supporting higher education spending; however, budget constraints have made the increases quite modest. In addition, the federal government contributes less than 10 percent of the funding of K-12 local public

schools. Republicans have been advocating a bloc grant approach, with local leadership having wide latitude in spending any new money from Washington. The Republican leadership in Washington has been consistently opposed to any national standards. Congressional Democrats and the Clinton administration prefer targeting any increased K-12 education spending to hiring new teachers and funding after-school programs.

Among the presidential candidates, most Republicans—including Texas Governor George W. Bush—are advocating increased use of school vouchers. The two Democratic candidates are opposed to vouchers.

There is a cadre of mostly Republican conservatives in Washington who believe that many of the problems in the public schools are attributable to moral decline. Senate Republicans have authorized a new task force (proposed by Sen. Brownback of Kansas) to investigate the effects of Hollywood productions (both TV and movies) on American culture, and especially on young people. Republicans associated with this group have regularly introduced legislation allowing prayer in school, encouraging the expulsion of unruly students, and encouraging other measures to enforce discipline in the classroom. Their counterparts in several, mostly southern, states have urged the “return” of the Ten Commandments to the classroom.

Finally, on school violence, the Republican leadership in Washington has been supporting tougher crime legislation with a particular emphasis on increasing sentences for juvenile offenders. The Democrats’ position on school violence is toughening gun control laws, including mandating trigger locks for all firearms.

RATING PUBLIC SCHOOLS Table 1

In the Joint Center’s National Opinion Poll, the gap between black and white satisfaction with local public schools had narrowed between 1997 and 1998, but it widened again between 1998 and 1999. A solid majority of whites (59.7 percent) rated their local public schools as excellent or good in 1999, while only 39.7 percent of blacks did so (see below). This 20 percentage point gap is almost twice as large as the 11.6 percentage point gap between blacks and whites observed in the 1998 survey. As there was little

	Black Population			General Population		
	Excellent/Good %	Fair %	Poor %	Excellent/Good %	Fair %	Poor %
1996	41.0	37.0	16.5	63.7	22.7	7.4
1997	34.3	37.7	23.3	56.9	26.2	13.3
1998	45.8	30.4	16.8	54.4	25.3	16.1
1999	39.7	35.2	22.9	59.0	26.5	11.2

difference in whites’ favorable school ratings between 1998 and 1999, most of the evaluation gap increase was due to fewer blacks giving excellent or good ratings to their schools. This decline returns the black-white satisfaction gap to where it was prior to 1998—approximately 20 percentage points. As discussed

above, the unusually high level of financial optimism seen in the 1998 survey may have influenced the ratings of local public schools.

There has also been a corresponding increase in the proportion of blacks rating their local public schools as poor, from 16.8 percent to 22.9 percent. Only 10.7 percent of whites rated their local public schools as poor.

There were several subgroup differences among blacks in rating their local public schools. Respondents from the Northeast (66 percent fair or poor) and the Midwest (68 percent fair or poor) were likely to rate their local public schools more negatively than those from the South (56 percent fair or poor) or West (33 percent fair or poor). Young black adults (65 percent fair or poor), black liberals (61 percent fair or poor), and Christian conservatives (64 percent fair or poor) were more negative in their judgements than older blacks or moderates (53 percent fair or poor) and secular conservatives (51 percent fair or poor). African Americans from households with the highest income (more than \$90,000) gave the best overall rating to their local public schools, with a majority (52 percent) rating their local schools as excellent or good and only 44 percent rating them fair or poor. Two other black subgroups with comparatively positive views of their local public schools were those without a high school diploma and those from households making less than \$15,000 per year; their responses were evenly divided between excellent/good and fair/poor. African Americans in the middle-income ranges gave more negative evaluations of their local public schools, with persons from upper-middle-income households (\$60-\$90,000) being the most negative (67 percent fair or poor).

Among the subgroups of the general population, persons older than 50 years (63-64 percent excellent or good), and those from households with incomes of \$60,000 or more (64-66 percent excellent or good) rated their local public schools very favorably. In direct contrast to the black population, those in the general population (mostly whites) from the Northeast (63 percent excellent or good) and the Midwest (66 percent excellent or good) rated their local public schools more favorably than those from the South (53 percent excellent or good) or the West (57 percent excellent or good). Those from lower income households (less than \$35,000) were less positive in their ratings of local public schools (50-52 percent excellent or good) than those from middle (56 percent excellent or good) and upper-middle (66 percent excellent or good) income households.

SCHOOL PROGRESS

Table 2

To further examine how people feel about their local schools, respondents were asked whether over the past five years, schools have gotten better or worse. Roughly similar proportions of blacks and whites believe that schools in their community have gotten better or stayed the same; however, a significantly higher proportion of blacks answered that the schools in their community have gotten worse. In the 1999 survey, 28 percent of blacks and 27 percent of whites thought their local schools were better than five years previously; 33 percent of blacks and 40 percent of whites thought their local schools were unchanged over that time period; and 34 percent of blacks and 24 percent of whites thought their local schools had gotten worse. For whites, the responses to this question were unchanged from those from the 1998 survey. For blacks, the proportion of respondents saying that local schools had gotten worse increased by 23 percent.

In the black population, there were age differences, with those under 50 years (37-39 percent) more likely to think their local schools were getting worse than those over 50 years (27 percent). College-educated African Americans (42 percent worse) and those from upper-middle-income households (45 percent worse) were the subgroups most likely to think their local schools were getting worse. Black secular

conservatives were the subgroup most likely to believe their local public schools were getting better (38 percent). There were no particularly interesting subgroup differences in the general population.

SCHOOL VIOLENCE Table 3.

Respondents were asked whether they were aware of any incidents of school violence near where they lived. Given the events at Columbine High School in Littleton, Colorado, school violence was a problem that a great many people had been thinking about. However, despite Columbine, the proportion of people reporting violence at a school near where they lived in the 1999 survey was down substantially from the 1996 survey when this question was last asked; this decline in reporting violent incidents corresponds to an actual decline (as reported in government statistics) in incidents of school violence over the 1996 to 1999 time period.

Among African Americans, 31 percent said they were aware of a violent incident at a school near where they lived; this represents a 20 percent decline from the 1996 survey when 39 percent reported such incidents. Among whites, 27 percent reported knowledge of a violent incident, which represents a 17 percent decline from 1996.

Among the subgroups of the black population, those between 18 and 25 years of age (51 percent), and persons from upper-middle-income households (43 percent) were the most likely to report a violent incident at a nearby school; these two subgroups were also more likely than others to report such incidents in the 1996 survey. Black seniors (24 percent) and persons from lower-middle-income households (24 percent) were the least likely to report violent incidents at nearby schools.

Among the subgroups of the general population, those between 18 and 25 years old (43 percent), and those without a high school diploma (36 percent) were the most likely to report a violent incident at a school near where they lived.

SCHOOL SPENDING Table 4

The school spending debate in Washington and elsewhere is not surprising since large majorities of both black and white Americans think too little is being spent on education. In the black population, 82 percent of respondents believe the government is spending too little on education, while 68 percent of whites think likewise; for blacks, this represents a 7 percent increase (in the proportion of those thinking too little is being spent) since last year's survey, and for whites it represents a 14 percent increase.

In the black population, large majorities of all subgroups think too little is being spent on education; black seniors (71 percent too little) and those without a high school education (69 percent too little) were the subgroups that were (comparatively) less likely to think too little was being spent on education.

Despite the strong support for increased school spending in the general population, the nature of the debate in Congress on education generally, and about Littleton in particular, is manifest in the survey findings. In the recent congressional debate, there have been conservative members of Congress—especially those associated with conservative Christian groups—who have argued that money is not the most important issue in education, but rather the schools' failure to inculcate moral values. Many of these members of Congress think more than enough money is being spent on education. These two sides of the debate are seen in the general population, where liberals (85 percent) strongly support increased education

spending, and (predominantly white) conservatives—both secular and Christian—are least supportive; although a majority (54 percent) does support increased education spending.

Besides the “money vs. morality” differences in the general population, there were also (long-term) differences between those under 35 years (79-84 percent favor increased spending on education) and senior citizens (54 percent favor increased spending).

SCHOOL VOUCHERS Table 5

Among African Americans, support for school vouchers in the 1999 survey shows a 25 percent increase in support from last year; white support for school vouchers increased by a similar margin (27 percent increase) and for the first time since this question was first asked in the Joint Center’s 1996 National Opinion Poll, a majority of whites indicated support for school vouchers. A substantial majority of the black respondents (60 percent) supported school vouchers, while only one-third of the black respondents rejected them; 52 percent of whites favored vouchers and 41 percent opposed them (see below). In the 1998 survey, there had been a 16 percent decline from the year earlier in support for vouchers as well as a similar decline among whites.

	Black Population		General Population	
	Support Vouchers %	Oppose Vouchers %	Support Vouchers %	Oppose Vouchers %
1996	48	44	43	50
1997	57	38	48	46
1998	48	40	42	50
1999	60	33	53	40

It remains somewhat unclear where school vouchers fit in the overall issue of K-12 education. Most school voucher proposals have been limited in nature, often targeted only at students from the worst schools and at minority students. Many opponents of school vouchers believe vouchers take money away from the public schools and violate the separation of church and state. Further, they believe that the targeting of minority students in poor schools by school voucher advocates represents a first step in a long-term strategy to make school vouchers more generally available.

It is clear in evaluating the results from Joint Center surveys between 1996 and 1999 that both black and white views on the school voucher issue are somewhat volatile, although blacks have generally favored school vouchers more than whites. This volatility is not surprising because public knowledge of school vouchers is low.³ Nevertheless, vouchers appear to have two main attractions: for some people, vouchers represent an alternative to a status quo (e.g., poor schools) they dislike; other people are attracted to vouchers because of the “choice” vouchers offer.⁴

In both the 1998 and 1999 Joint Center surveys, there was an interesting relationship between evaluations of local public schools and support for vouchers; however, the nature of the relationship was different for blacks and whites. In the 1998 survey, blacks’ ratings of their local public schools improved significantly

from the previous year with 34 percent more excellent and good ratings (from 34 to 46 percent excellent or good), while support for school vouchers declined 16 percent. Between 1998 and 1999, the proportion of blacks rating their local public schools as excellent or good declined 16 percent, and the proportion supporting school vouchers increased 25 percent (from 48 to 60 percent). In contrast, between 1997 and 1998, the proportion of whites rating their local public schools as excellent or good declined five percent, and support for school vouchers declined 13 percent. Between 1998 and 1999, the proportion of whites rating their local public schools as excellent or good increased five percent, and the proportion of whites supporting school vouchers increased 27 percent. In sum, the relationship between the two questions is a positive one for whites, and an inverse one for blacks.

The clear generational differences on support for school vouchers that emerged in the Joint Center's 1997 survey were more muted in the 1998 survey, but reemerged in this year's survey. Among blacks, two-thirds of baby boomers and more than 70 percent of those younger than 35 years supported school vouchers, while a small plurality (49 to 44 percent) of those between 51 and 64 years supported vouchers, and a plurality (49 to 42 percent) of black seniors opposed them. Black Christian conservatives (68 percent in favor), persons from the lowest-income households (72 percent) and the highest-income households (71 percent), and persons from households with children (71 percent) were the black subgroups that were most favorable to vouchers. As noted above, blacks over 50 years were the most opposed to vouchers.

Similarly, solid majorities of those under 50 in the general populace supported vouchers, while a plurality of those between 51 and 60 years (47 to 46 percent) and a majority of seniors (51 to 38 percent) opposed school vouchers. Conservatives (59-60 percent), persons without a high school degree (73 percent), persons from the lowest-income households (59 percent), and persons from households with children (63 percent) were the subgroups of the general population most supportive of vouchers—and as with the black population, seniors were most opposed.

STATEWIDE STANDARDS AND TESTS Table 6

Respondents were queried on their views on statewide standards and tests as to whether they were mostly good, i.e., they ensure competitive skills needed for college or the workplace, or problematic, i.e., they are discriminatory to minority students and represent a barrier to attaining high school diplomas. While blacks were more guarded in their support for statewide standards than whites, a solid majority of black respondents favored statewide standards and tests (55 vs. 37 percent); whites overwhelmingly favored statewide standards (71 vs. 17 percent).

Among the subgroups of the black population, those from the Northeast (65 vs. 29 percent), those with at least a college degree are (60 vs. 33 percent), and those from upper-middle income (68 vs. 27 percent) and upper-income (76 vs. 22 percent) households are more supportive of statewide standards. African Americans without a high school diploma represent the black subgroup most opposed to statewide standards and tests, with a plurality (47 vs. 44 percent) believing that such standards and tests are unfair. Also, young black adults (52 to 46 percent) are fairly evenly divided between those who think the tests and standards beneficial and those who think them unfair.

Among the general population, a substantial majority of every subgroup support statewide standards and tests. Those subgroups of the general population with the largest proportion of respondents who believe statewide standards and tests are unfair include persons between 18 and 25 years (30 percent think the standards and tests unfair), liberals (30 percent), and those without a high school diploma (32 percent).

NOTE ON METHODOLOGY

The survey was designed and the questionnaire developed at the Joint Center for Political and Economic Studies. The overall study design consisted of two sample groups: a national general population sample of 850 people and a national sample of 900 African Americans. There are 72 African American respondents in the general population sample who are also part of the national sample of African Americans. Thus, in total, there are 1,678 adults, 18 years of age or older, who are included in this study.

The survey results are based upon (random digit dialing) telephone interviews with 1,678 adults that were conducted between May 3, 1999, and May 28, 1999. The field work was done by Research America of Philadelphia. Randomized procedures were used to select respondents within each household reached by telephone, and after the initial call there were at least three call-backs if no interview was completed.

The results of this survey for both the general population sample and the black population sample should be interpreted with a statistical margin of error of plus-or-minus 3.5 percentage points. Actually, this survey like all surveys, does not have a margin of error. The individual items in the survey have margins of error; the margin of error for a question is based upon its sample variance, the level of confidence desired (e.g., 95 percent), and upon sample size.⁵ The 3.5 percentage points are a conservative estimate of margin of error; many items, especially those where large majorities of either sample hold similar positions, have a margin of error much smaller than 3.5 percentage points.

In addition to the random error component in surveys, there are potentially non-random errors that may be present. While this survey is based upon random digit dialing techniques that effectively deal with potential problems in telephone surveys such as unlisted numbers and new numbers, non-response in telephone surveys produces a variety of known (and probably some unknown) biases. Further, a telephone survey by definition defines its population as those individuals with some reasonable expectation of being reached by telephone. Such a definition, of course, eliminates certain populations; for example, most homeless people, and others living in poverty, who are unreachable by phone are not part of the sample population. Thus, the statements made based upon this survey are most likely not generalizable to homeless people, black or white.

During the field work phase of the survey, an effort was made to maximize the use of same-race interviewers, and a majority of the interviews were conducted with same-race interviewers (black interviewers for black respondents and white interviewers for white respondents).

The sample data from the overall survey are weighted in the analyses to population parameters for a variety of demographic factors.⁶ The parameters used in this weighting are from the U.S. Census Bureau's 1996 Current Population Survey and prior Joint Center surveys.

NOTES

1. See these three Joint Center reports: *1996 National Opinion Poll: Social Policy*; *1997 National Opinion Poll: Children's Issues*; and *1998 National Opinion Poll: Education*.
2. For example, the Joint Center's 1999 National Opinion Poll was fielded shortly after the killings at Columbine High School in Littleton, Colorado. The images of deaths and violence in a well-to-do suburban high school that were featured so prominently in the news caused many Americans to think that schools were unsafe places. In reality, deaths and violence in schools had been declining over this time period (1996-1999), in other words, schools were safer. Nonetheless, most of the schools in the country had instituted tough new safety measures by the start of the new school year.
3. In the 1998 Joint Center National Opinion Poll, respondents were asked several questions on school vouchers and the responses indicated a low level of knowledge and little familiarity with them.
4. There is one group of people who do have first-hand knowledge of the array of issues surrounding school vouchers, namely people with children in private or parochial schools. For them, school vouchers would represent a very significant and tangible financial benefit.
5. A random sample is a random subset of a population. One makes observations on suitable units of a random sample in order to make statements about the population and to estimate the error associated with such statements. A common misconception regarding surveys and associated statistical theory, is that 'population' (or population size) is a factor in margin of error. This is not true. Population does not appear in the statistical formulation for margin of error.
6. In the tables attached to this report, the black population sample size is reported as 925 rather than 900. The difference is attributable to the weighting of the black sample to achieve desired population distributions.

Table 6

Which of the following statements is closer to your views: Statewide standards or tests for high school graduation are a good thing and will ensure that students leave school with the skills they need to compete in the workforce or college—or—Statewide standards or tests are unfair because they prevent or make it more difficult for minority students to receive a high school diploma.
